In a general sense, spatial cognition is a critical ability of humans and non-human animals (e.g., migratory birds, bees, rodents), through which an organism acquires, represents, organizes, understands and navigates the environment; attends to specific objects; mentally manipulates objects; and communicates information about objects and the environment to others (Spence and Feng, 2010). Thus, it is not at all straightforward to strictly define spatial cognition.

Spatial cognition is concerned with the acquisition, organization, utilization, and revision of knowledge about spatial environments. These capabilities enable individuals to manage basic and high-level cognitive tasks in everyday life.

Spatial cognition - Wikipedia
Tolman coined the term cognitive map, which is an internal representation (or image) of external environmental feature or landmark. He thought that individuals acquire large numbers of cues (i.e. signals) from the environment and could use these to build a mental image of an environment (i.e. a cognitive map).

We therefore investigated the effects of chronic lifetime exposure to aspartame, commencing in utero, on changes in blood glucose parameters, spatial learning and memory in C57BL/6j mice. Morris Water Maze (MWM) testing was used to assess learning and memory, and a random-fed insulin tolerance test was performed to assess glucose homeostasis.
