PostgreSQL Synchronous Replication . As the name suggests that data is replicated to the secondary at the same time as it is written on the primary. The main idea of PostgreSQL sync replication lies in the fact that changes must be on at least a couple of servers before primary returns a positive response or success to the secondary or a slave node.

PostgreSQL Sync Replication: Detailed Guide for ...

This is the default configuration. Even when synchronous replication is enabled, individual transactions can be configured not to wait for replication by setting the synchronous_commit parameter to local or off. This parameter can only be set in the postgresql.conf file or on the server command line.

You can read from the Slave servers using the IP addresses of the Slave servers. But you add new data only to the Master server.

PostgreSQL Streaming Replication: Made Easy

PostgreSQL database supports several replication solutions to build high-availability, scalable, fault-tolerant applications, one of which is Write-Ahead Log (WAL) Shipping. This solution allows for a standby server to be implemented using file-based log shipping or streaming replication, or where possible, a combination of both approaches.
